A method and system for providing a configurable jewelry closure is disclosed. The configurable jewelry closure comprises a series of common jewelry fasteners on links. The fasteners are easily opened and designed for continual opening, by the wearer. These easy opening fasteners provide the wearer the ability to attach jewelry strands of varying color, number and length to provide the wearer with a customizable piece of jewelry. These jewelry closures can be removed from the jewelry strand by the wearer over and over again rendering it still usable and customizable by the wearer.
